India is located in south SIA.

A E I O U

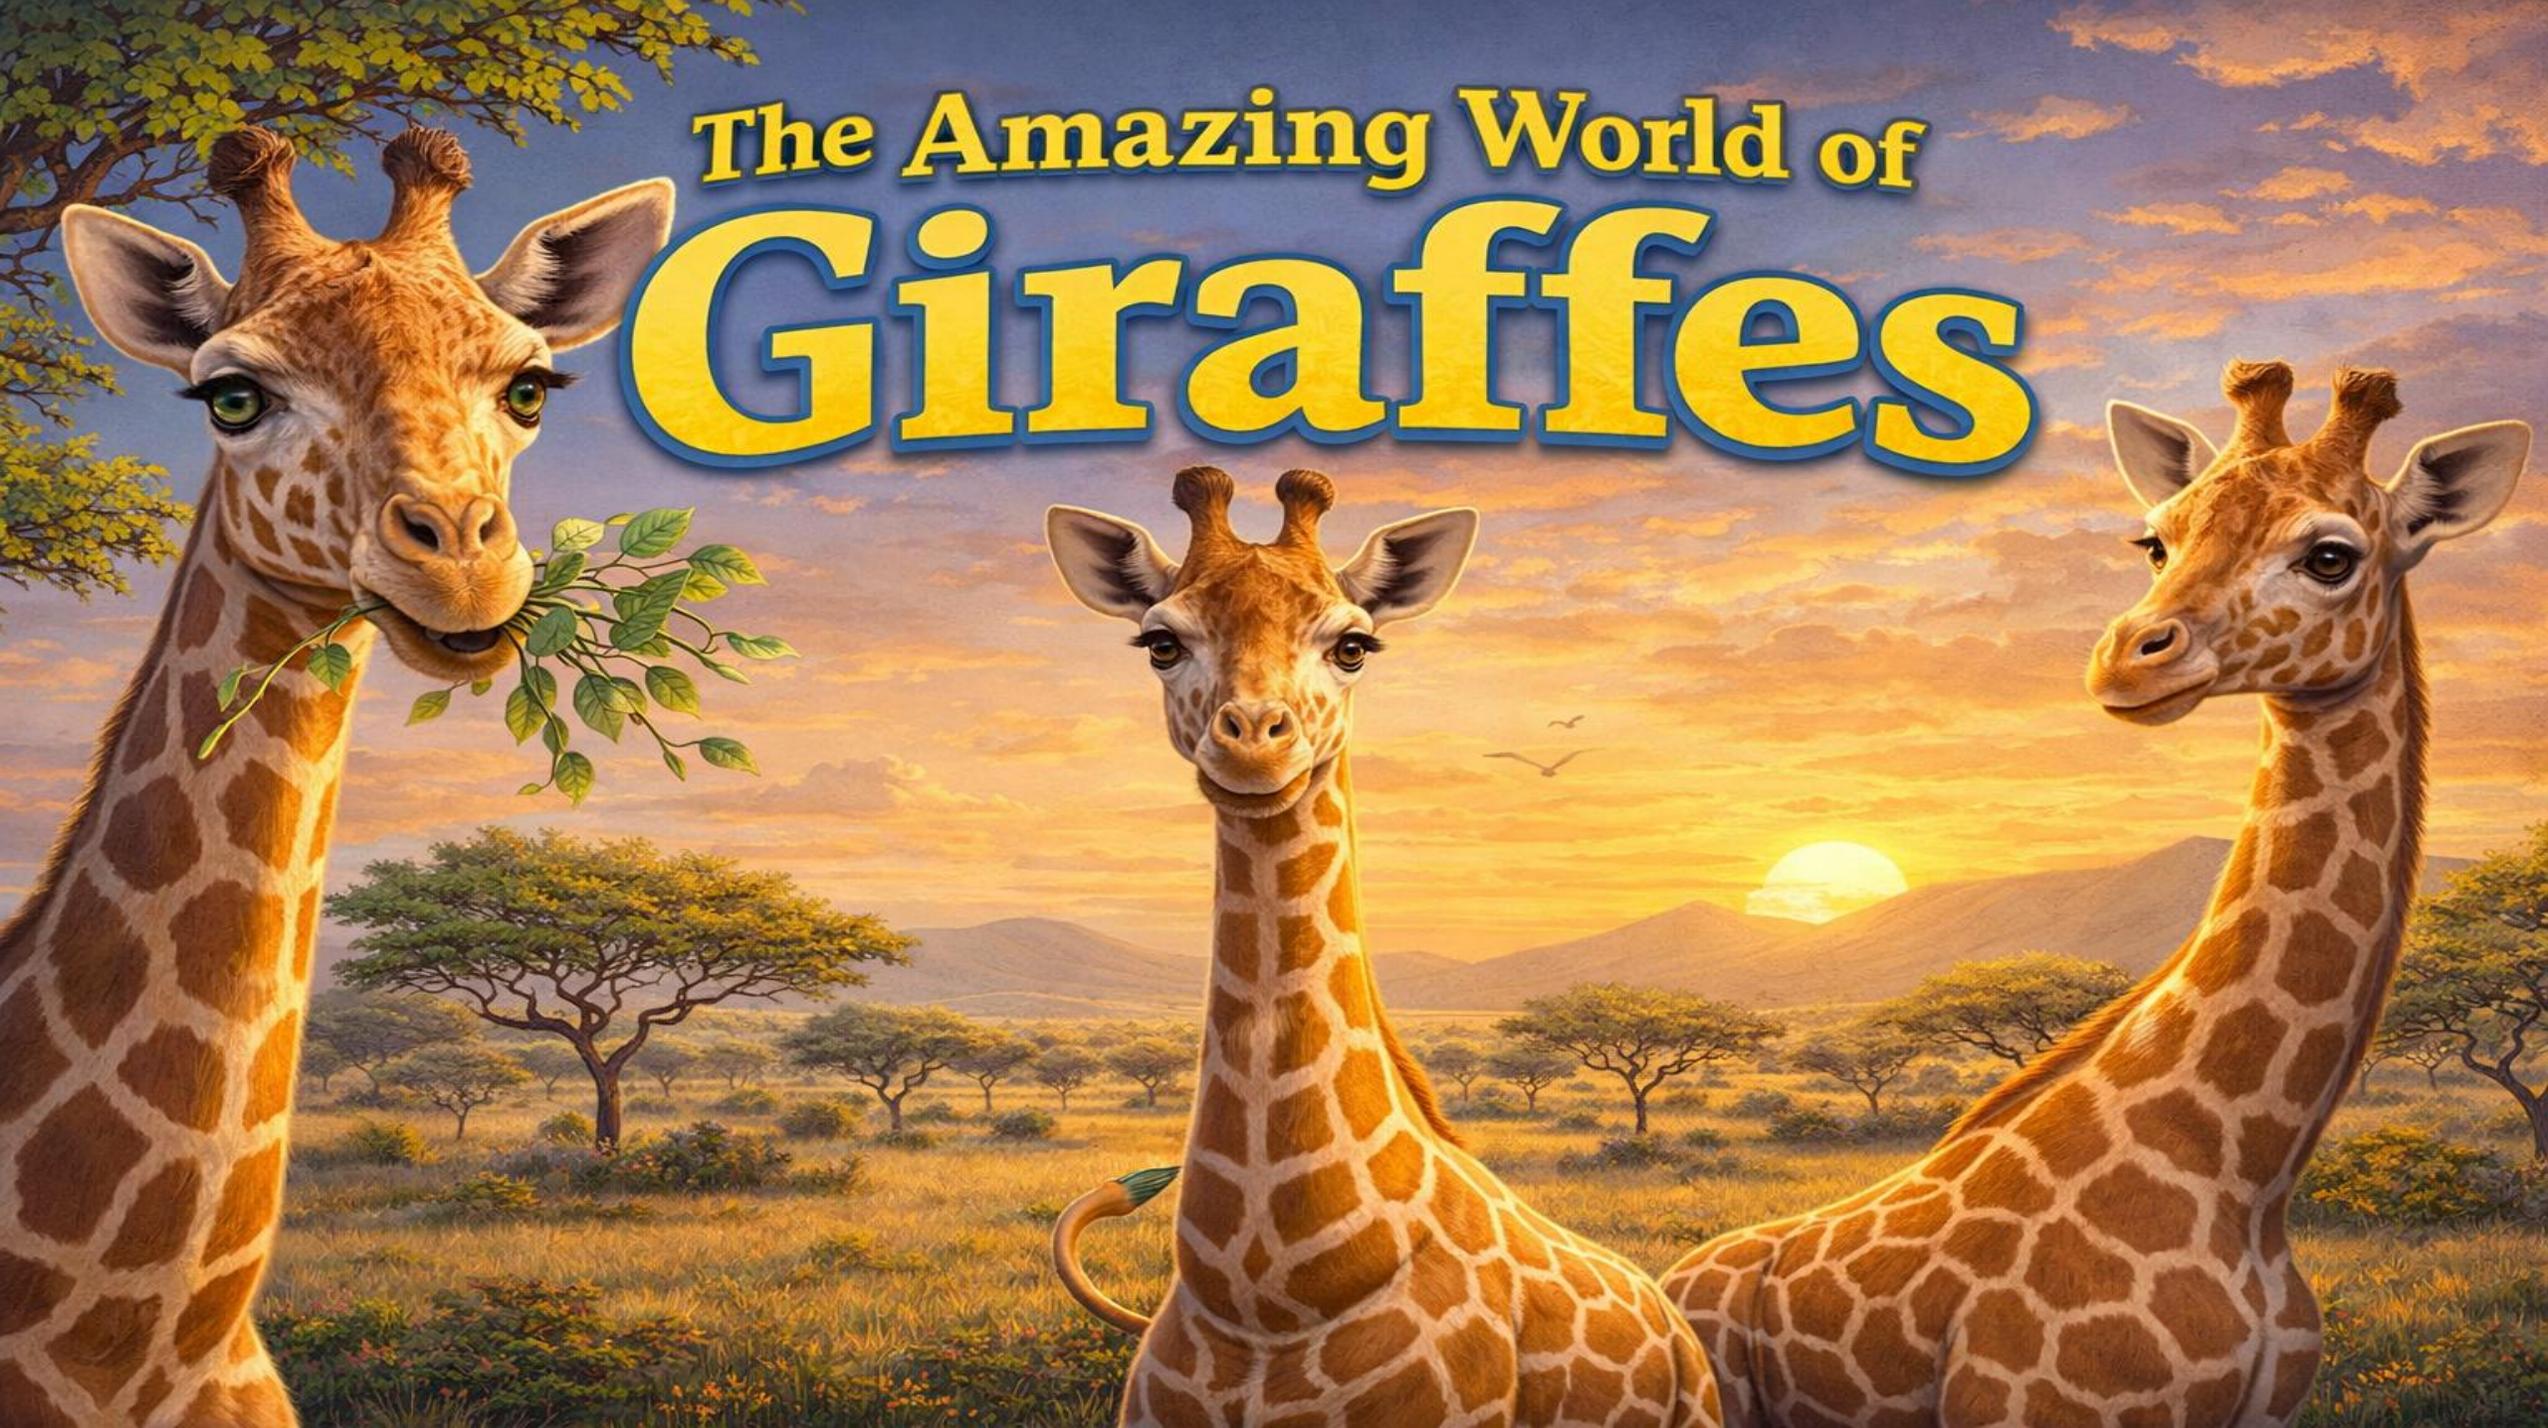

**The question was COMICPLATE, so he sought help
from his friend.**

D E C T I

**The question was COMICPLATE, so he sought help
from his friend.**

D E C T I

The Amazing World of **Giraffes**

The Amazing World of Giraffes

Giraffes are some of the most fascinating animals on Earth. They are the tallest land animals, with legs so long that they can be as tall as a house! Their extraordinary height helps them reach leaves high up in trees that other animals cannot eat.

A giraffe's long neck might look delicate, but it is actually very strong. Surprisingly, it has the same number of bones as a human neck—just seven—but each bone is much longer. This clever design allows giraffes to stretch upwards while still being able to bend down to drink water (which is quite a tricky task!).

Their tongues are another remarkable feature. A giraffe's tongue can be up to 45 centimetres long and is often a dark purple colour. This helps protect it from the sun as they spend hours reaching into trees to pull off leaves.

Giraffes are herbivores, which means they eat plants. They especially enjoy acacia leaves, even though these trees have sharp thorns. Luckily, giraffes have tough lips and long tongues that help them avoid getting hurt.

Living in the grasslands and savannahs of Africa, giraffes are well adapted to their environment. Their spotted coats help them blend in with the dappled light of trees, making it harder for predators to spot them. Each giraffe has a unique pattern of spots, just like a human fingerprint.

Although they look gentle, giraffes can defend themselves if needed. Their powerful legs can deliver a strong kick that can scare away predators such as lions.

Giraffes are also social animals. They often live in loose groups called herds, but these groups can change often, with individuals moving in and out.

Sadly, giraffe populations are decreasing due to habitat loss and other challenges. This means it is important for people to help protect them and their homes.

In the end, giraffes are not just tall—they are extraordinary creatures with unique features that help them survive in the wild.
